

eDirectory Software System Requirements

eDirectory Service Versions (Basic and eCommerce)

- eDirectory handles the hosting and setup. All you need is a web browser! Note your directory can still run on your domain name, with your existing website and be seamless for the users. Contact us for more information.

eDirectory Owned License - Unix/Linux

- Apache with mod-rewrite enabled (mod-rewrite is not required, but allows for search engine friendly URLs. Most servers have it)
- PHP 4+ (5 if you have it)
- MySQL 4+ (5 if you have it)
- Ability to setup cron jobs
- GD 2+ Image libraries. This is installed on most linux machines by default and we can do it during install if you don't have it (root access may be requirement). eDirectory uses it to resize the uploaded images
- SSH access recommended for doing the setup (we can do it with FTP and some way to upload the database, but SSH makes it easier)

eDirectory Owned License – Windows

- It is possible to run eDirectory on a Windows server that has PHP and a MySQL database installed. There are some custom configuration requirements, so please contact a sales representative for more information prior to placing an order
